30 Dec 2017

# Modelling Strategy Overview

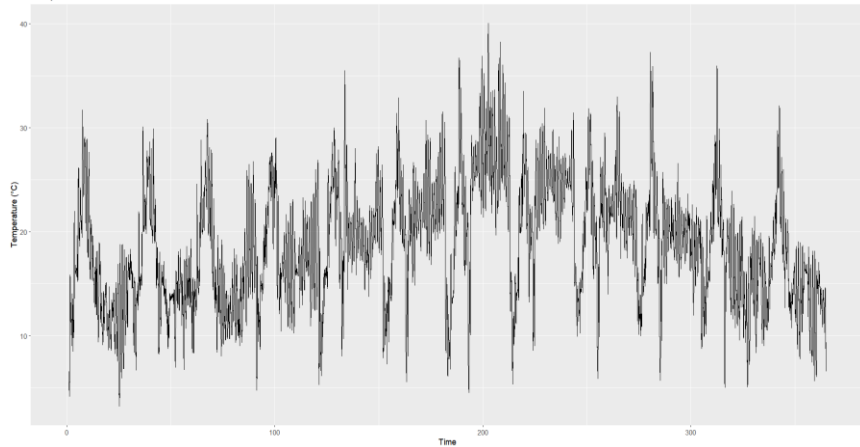

# Baseline Modelling Using Daily Aggregation - SARIMA

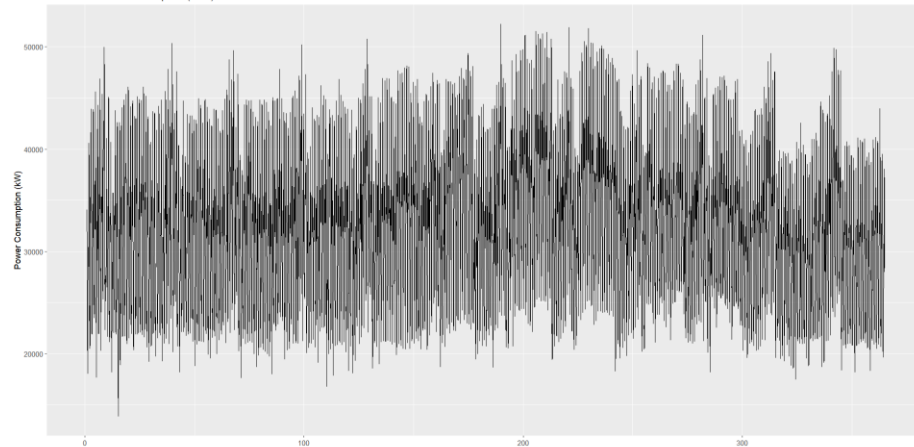

Model	AICc (approx.)	BIC (approx.)	Residual Diagnostics (Ljung-Box p-value)
ARIMA(0,1,1)	-949	-941	9.4e-07 (fails)
ARIMA(1,1,1)	-983	-972	0.0105 (fails)
ARIMA(0,1,2)	-954	-942	2.2e-06 (fails)
ARIMA(0,1,1) + drift	-947	-935	9.4e-07 (fails)
Best ARIMA via AICc/BIC (0,1,4)	-999	-980	0.83 (passes)
SARIMA(0,1,4) (0,1,1)[7]	-963	-940	0.91 (passes)

# Raw Time Series Overview

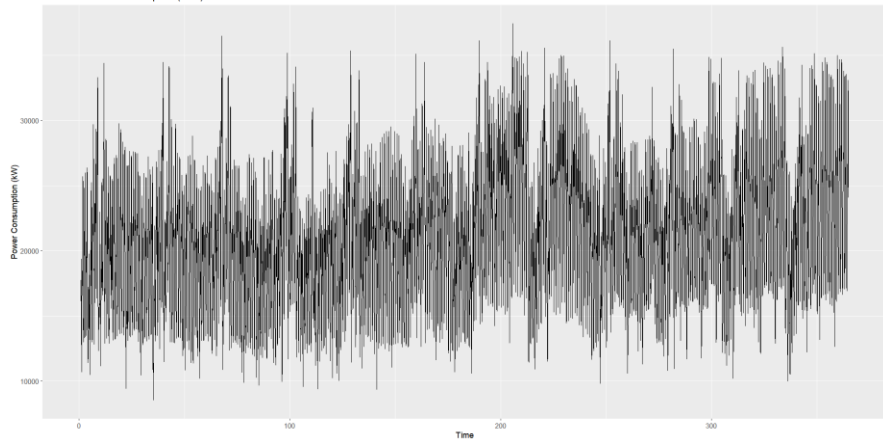

Temperature – 10-min Observations

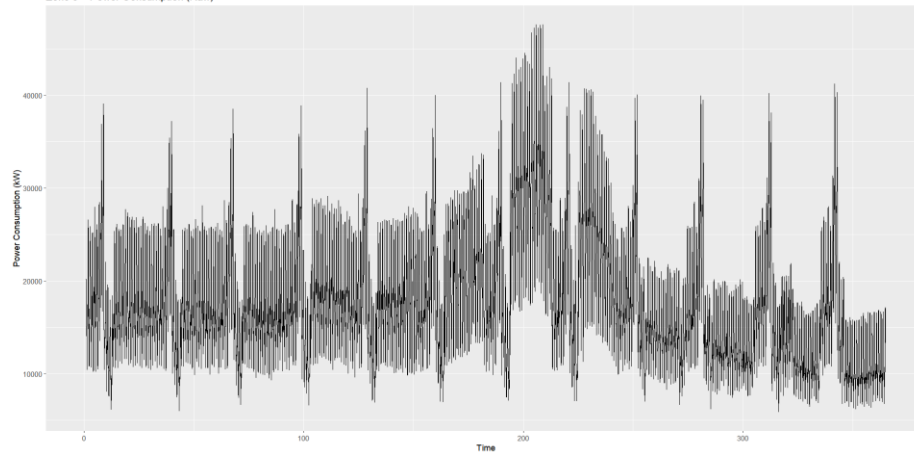

Zone 1 – Power Consumption (Raw)

Zone 2 – Power Consumption (Raw)

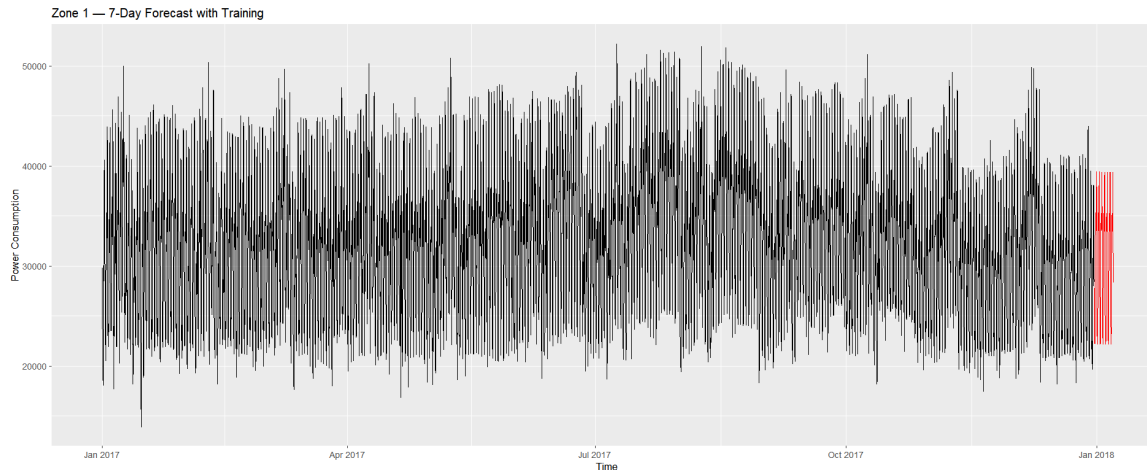

Zone 3 – Power Consumption (Raw)

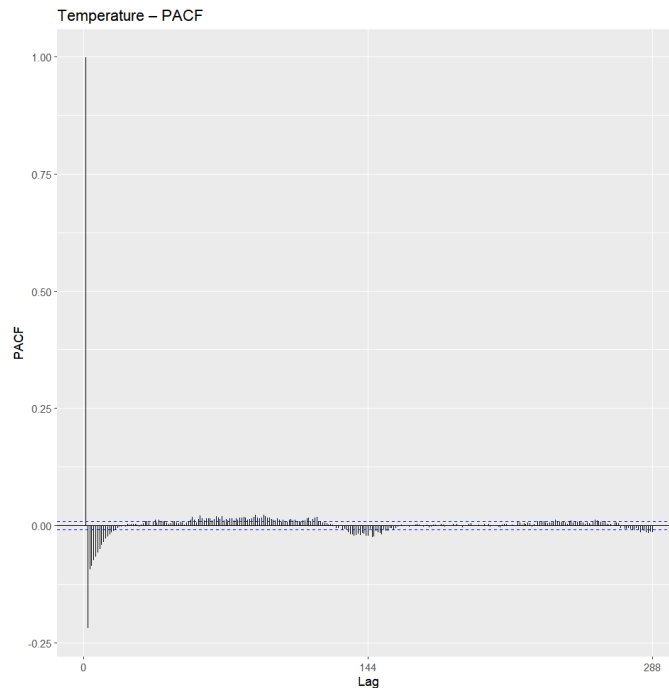

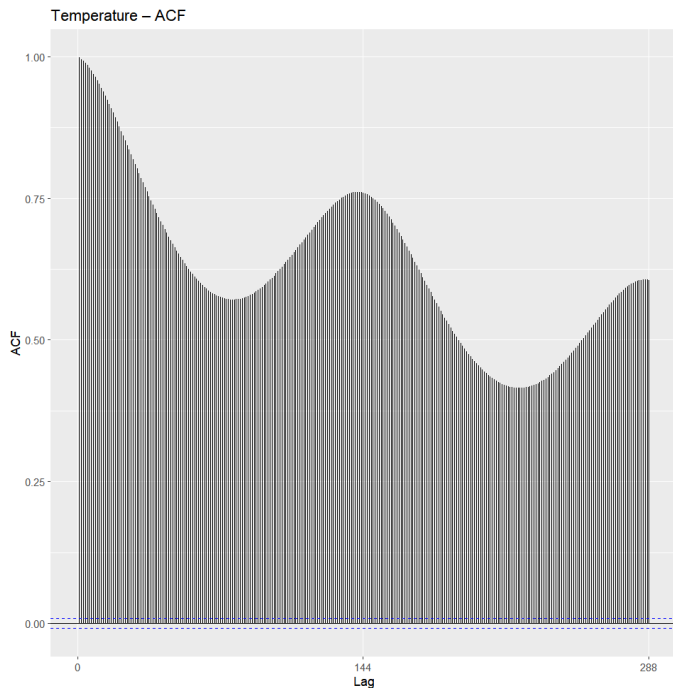

# High-Frequency VAR + ARMA–GARCH (10-Minute Data)

Model	Information Criteria / IC Selections	Residual Serial Correlation	Heteroskedasticity (ARCH)	Key Interpretation
<b>VAR(10)</b>	<b>SC selected p = 10</b> AIC → 24 HQ → 23 SC → 10	<b>Fail</b> — Portemanteau $\chi^2 \approx 50$ , df =8, $p \ll 0.001$	<b>Fail</b> — ARCH $\chi^2 \approx 7022$ , $p \ll 0.001$	VAR(10) still leaves autocorrelation and strong ARCH patterns.
<b>VAR(24)</b>	<b>AIC selected p = 24</b> HQ → 23 SC → 10 FPE → 24	<b>Fail</b> — Portemanteau $\chi^2 \approx 7677$ , df =480, $p \ll 0.001$	<b>Fail</b> — ARCH $\chi^2 \approx 6913$ , $p \ll 0.001$	Longer-lag VAR does not resolve autocorrelation or volatility.
<b>ARMA(1,1)–GARCH(1,1)</b> (Baseline, skew-t, Fourier K=6)	<b>AIC = -6.037 BIC = -6.0336</b>	<b>Fail</b> — LB on z: $\chi^2 \approx 758$ , $p \ll 0.001$	<b>Pass</b> — LB on $z^2$ : $p \approx 1$	Good variance modeling, mean autocorrelation remains.
<b>ARMA(3,3)–GARCH(1,1)</b> (Final, skew-t, Fourier K=6)	<b>AIC = -6.0387 BIC = -6.0346</b>	<b>Fail</b> — LB on z: $\chi^2 \approx 733$ , $p \ll 0.001$	<b>Pass</b> — LB on $z^2$ : $p \approx 1$	Lowest AIC; strong volatility fit; mean still autocorrelated.

# Temperature - Dependence & Stationarity Checks

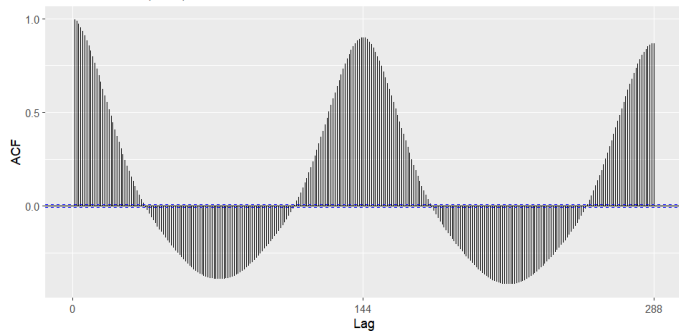

```
Extended ACF (EACF) – Temperature
> print(eacf(temp))
AR/MA
   0  1  2  3  4  5  6  7  8  9 10 11 12 13
0 x  x  x  x  x  x  x  x  x  x  x  x  x  x
1 x  x  x  x  x  x  x  x  x  x  x  x  x  x
2 x  x  o  o  o  o  o  o  o  o  o  o  o  o
3 x  x  x  o  o  o  o  o  o  o  o  o  o  o
4 x  x  x  x  o  o  o  o  o  o  o  o  o  o
5 x  x  x  x  o  o  o  o  o  o  o  o  o  o
6 x  x  x  x  o  o  o  o  o  o  o  o  o  o
7 x  x  x  o  x  o  o  o  o  o  o  o  o  o
```

**ADF:** pass (stationary in differences)  
**KPSS:** fails (not level-stationary)

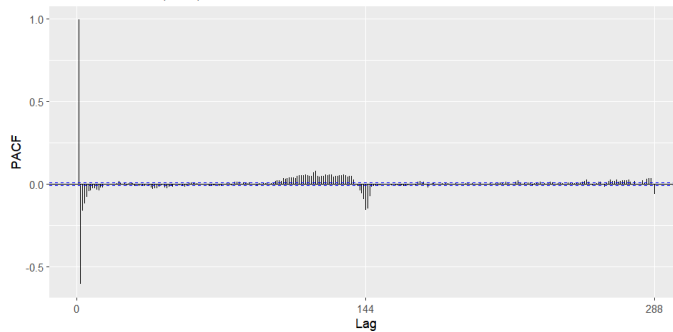

- Strong daily cycle
- Smooth, persistent autocorrelation
- Good candidate as exogenous regressor

# Zone 1 – Dependence & Stationarity Checks

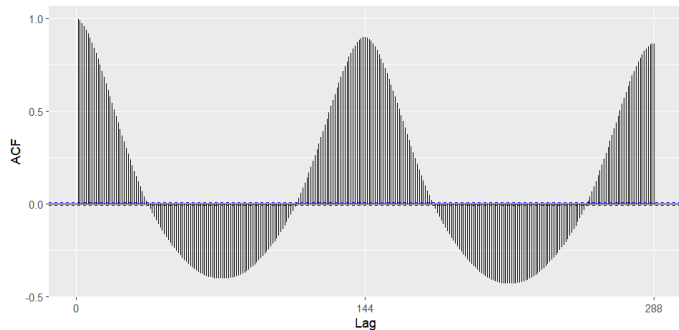

Zone 1 – ACF (Raw)

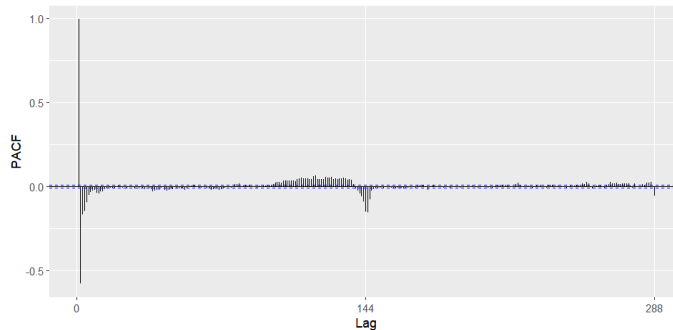

Zone 1 – PACF (Raw)

Zone 1 – ACF (Log)

Zone 1 – PACF (Log)

```
Extended ACF (EACF) – Log Zone 1
> print(eacf(lz1))
AR/MA
  0 1 2 3 4 5 6 7 8 9 10 11 12 13
0 x x x x x x x x x x x x x
1 x x x x x x x x x x x x x
2 x x o x o o o x o x o o o o
3 x x x x o o o x x o o o o o
4 x x x x o o o x x o o o o o
5 x x x x o o o x x o o o o o
6 x x x x o x o o x x x x o o
7 x x o x x x o o x o o o o o
```

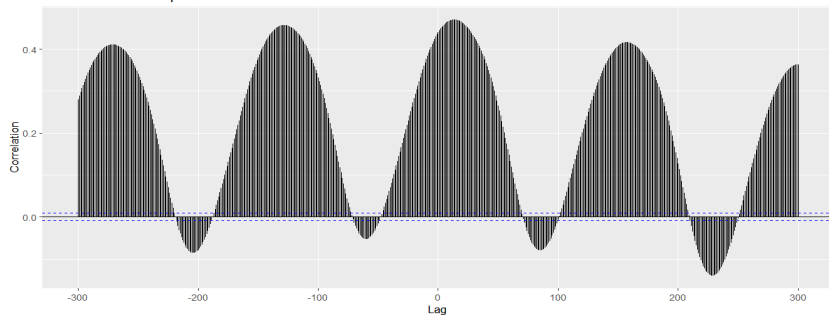

**ADF:** pass (stationary in differences)

**KPSS:** fails (not level-stationary)

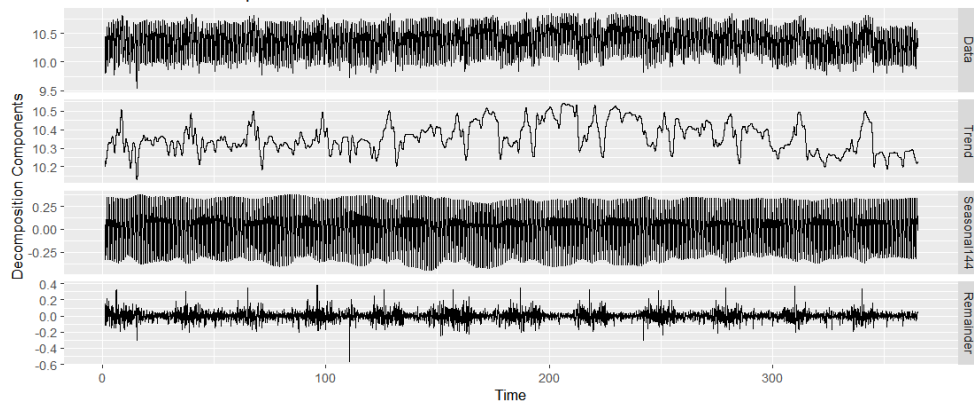

- Strong intraday seasonality
- Slow decay autocorrelation
- Needs seasonal adjustment

# Zone 1: CCF, MSTL, and Model Fit Diagnostics

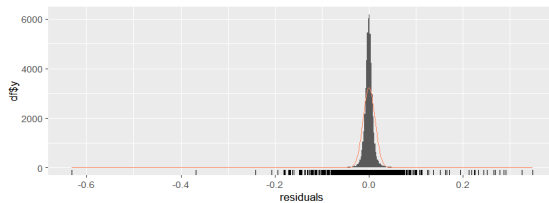

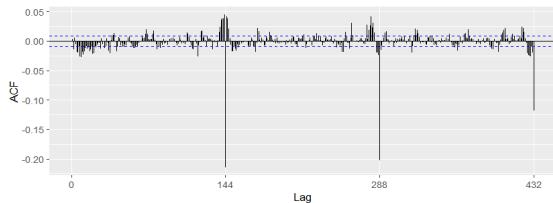

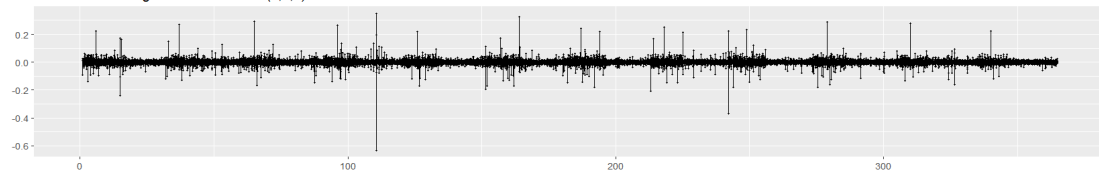

CCF: Zone 1 vs Temperature

Zone 1 – MSTL Decomposition

Residuals from Regression with ARIMA(3,1,2) errors

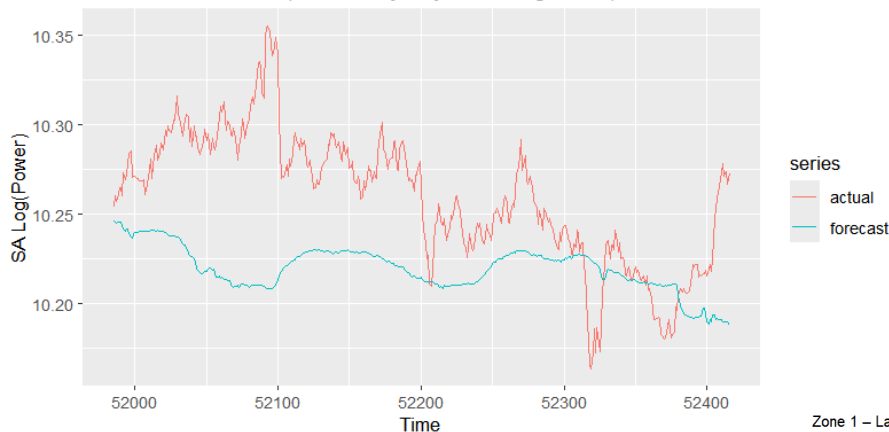

**CCF with Temperature:** clear repeating co-movement  
**MSTL:** dominant intraday cycle; small trend  
**Model Form:** ARIMA(3,1,2) + Fourier + Temperature  
**Residuals:** centred; variance stable; mild seasonal autocorrelation remains

## Model Selection

- AICc lowest among tested structures
- Fourier terms capture daily shape
- Temperature improves short-horizon alignment

# Zone 1 — Back-test Accuracy and 3-Day Forecast

Backtest — Zone 1 (Seasonally Adjusted, Log Scale)

## Back-test Accuracy (Seasonally Adjusted, Log Scale):

- **RMSE:** 0.05299
- **MAE:** 0.04404
- **MAPE:** 0.43%

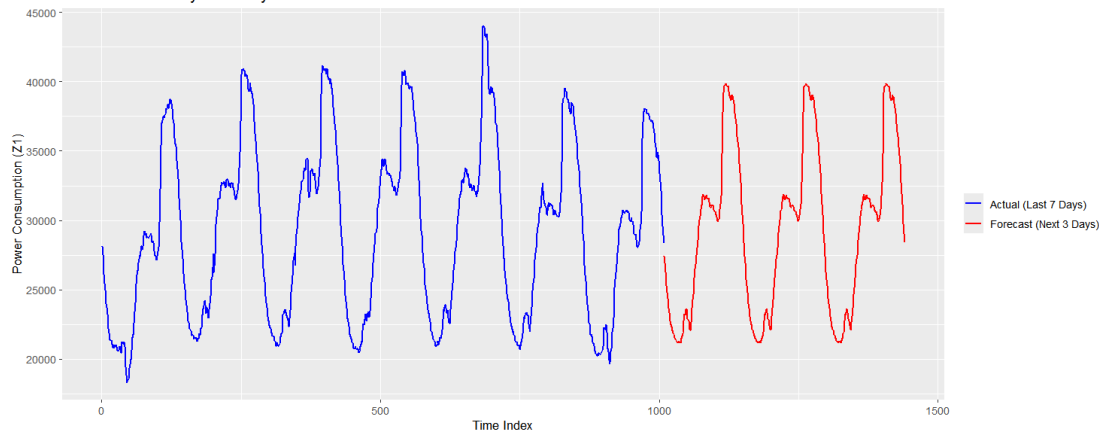

## Model Behavior:

- Captures intraday cycle reliably
- Forecast follows overall shape but smooths sharp drops
- Daily pattern recovered; level shifts under-tracked

## Final Takeaway:

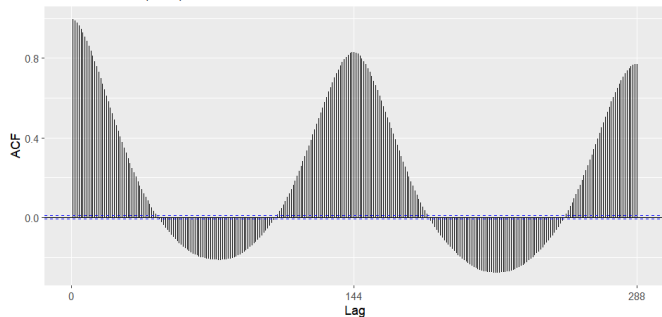

- Strong short-horizon pattern accuracy
- Limited capability for sudden load changes
- Sufficient as a **pattern forecaster**, not a **level-change** predictor

Zone 1 — Last 7 Days vs 3-Day Forecast

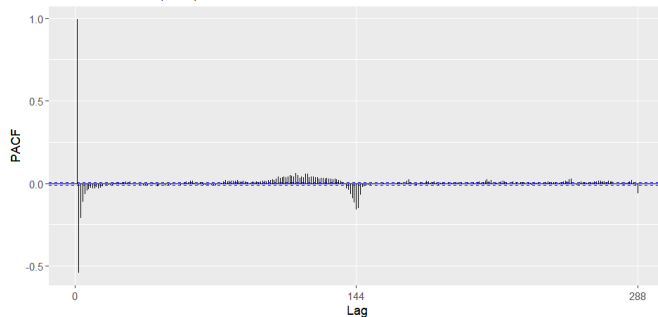

## Zone 2 – Dependence & Stationarity Checks

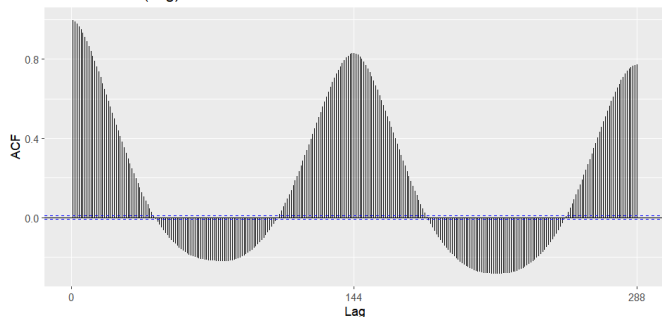

Zone 2 – ACF (Raw)

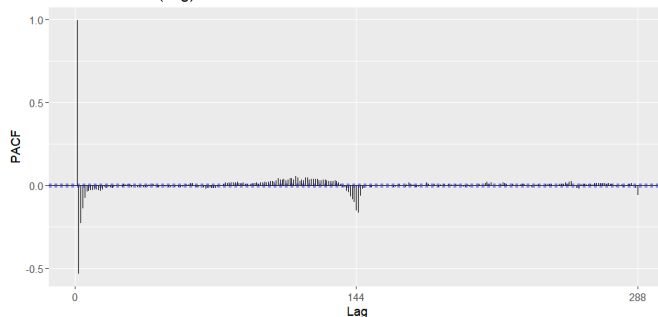

Zone 2 – PACF (Raw)

Zone 2 – ACF (Log)

Zone 2 – PACF (Log)

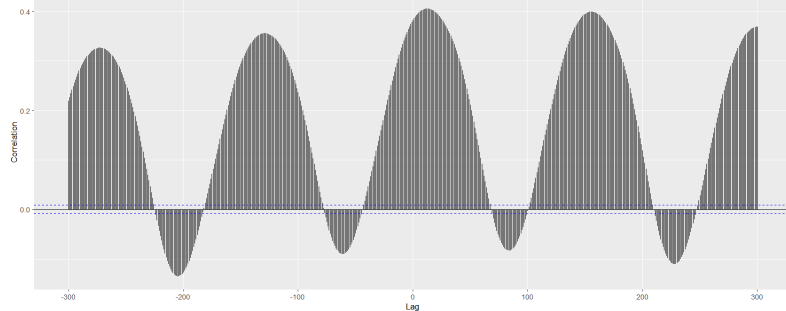

```
Extended ACF (EACF) – Log Zone 2
> print(eacf(lz2))
AR/MA
  0 1 2 3 4 5 6 7 8 9 10 11 12 13
0 x x x x x x x x x x x x x
1 x x x x x x x x x x x x x
2 x x o o x o o o o o o o o
3 x x x o x o o o o o o x o
4 x x x x x o o o o o o x o
5 x x x x x o o o o o o x o
6 x x x x o o o o o o o o o
7 x x x o o x o o o o x o o
```

**ADF:** pass (stationary in differences)  
**KPSS:** fails (not level-stationary)

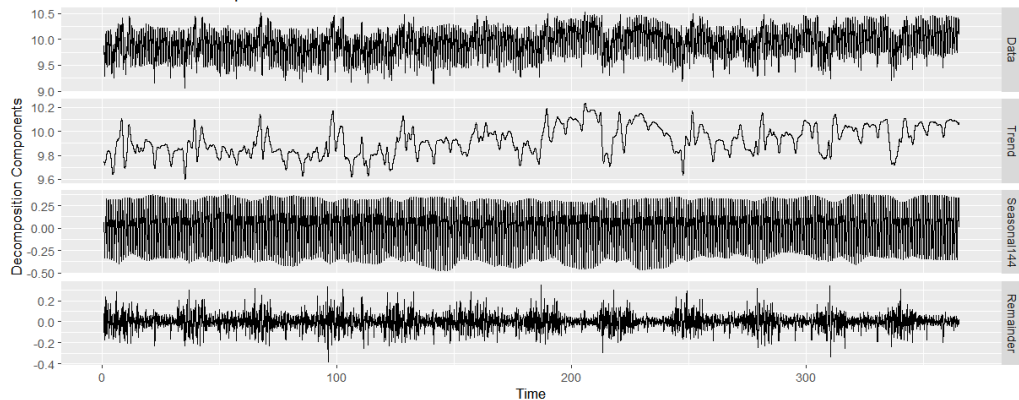

- High seasonal persistence
- Long memory behavior
- Requires seasonal removal

# Zone 2: CCF, MSTL, and Model Fit Diagnostics

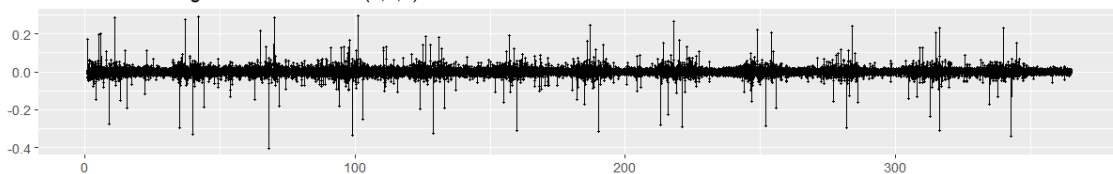

CCF: Zone 2 vs Temperature

Zone 2 – MSTL Decomposition

Residuals from Regression with ARIMA(0,1,5) errors

**CCF with Temperature:** clear repeating cycle; moderate co movement

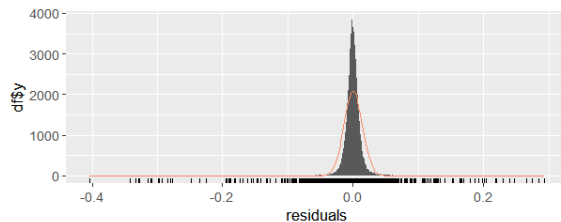

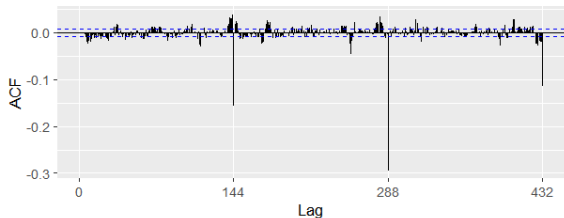

**MSTL:** strong 144-point intraday seasonality; mild trend drift

**Model Form:** ARIMA(0,1,5) + Fourier + Temperature

**Residuals:** centred; variance stable; small seasonal autocorrelation remains

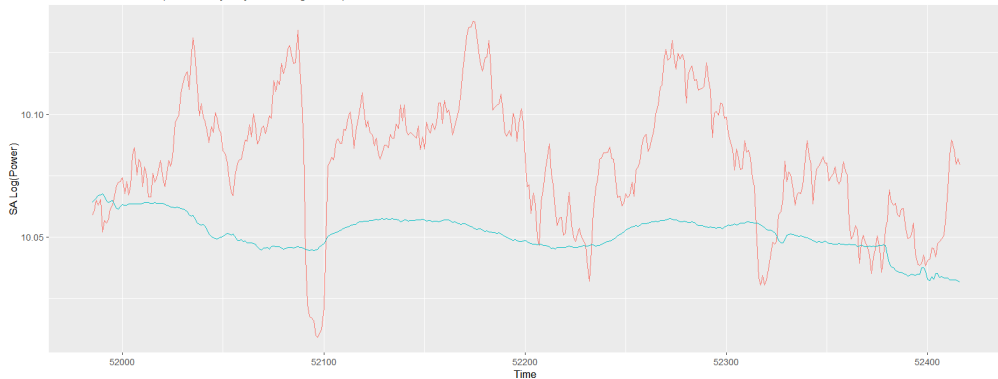

## Model Selection:

- Best AICc among candidate Zone 2 structures
- MA-dominant pattern aligns with EACF shape
- Fourier terms handle daily cycle; temperature improves short-term fit

# Zone 2 — Back-test Accuracy and 3-Day Forecast

Backtest — Zone 2 (Seasonally Adjusted, Log Scale)

## Back-test Accuracy (Seasonally Adjusted, Log Scale):

- **RMSE:** 0.03831
- **MAE:** 0.03247
- **MAPE:** 0.32%

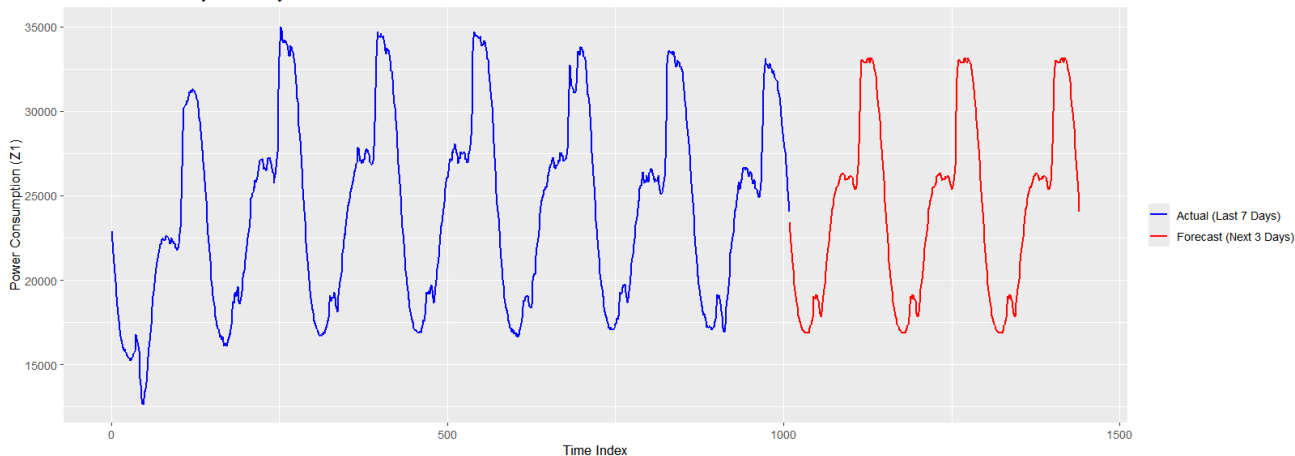

## Model Behavior:

- Recovers intraday cycle consistently
- Forecast tracks the general pattern but stays smoother
- Underestimates sharp rises and dips in demand

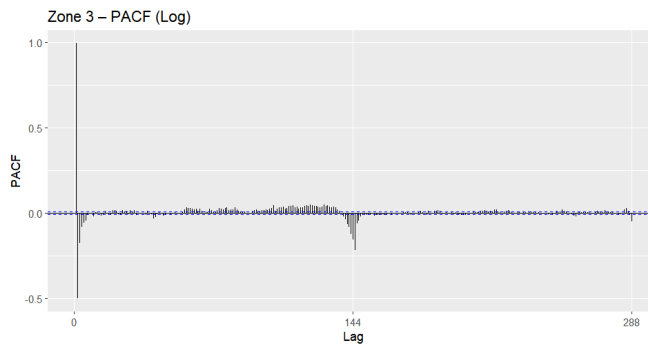

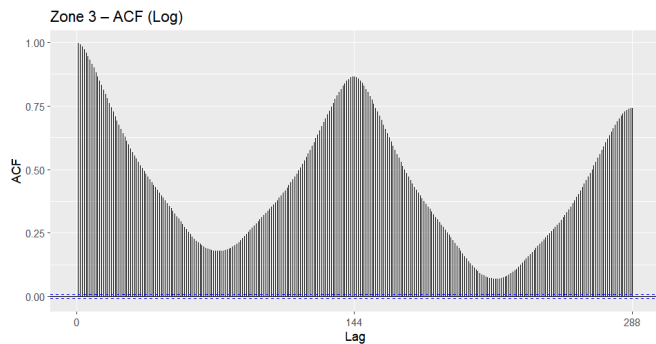

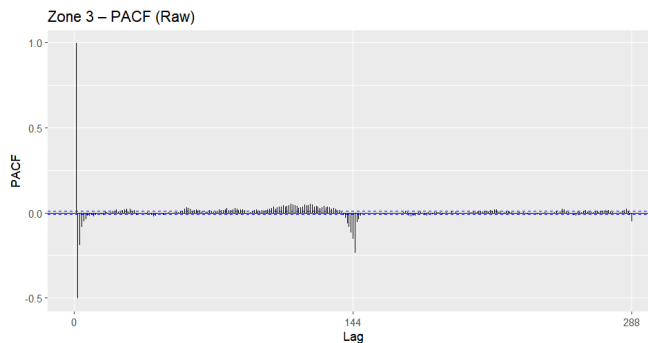

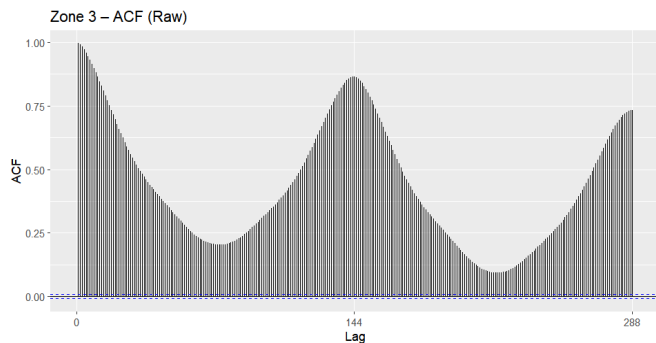

## Final Takeaway:

- Reliable short-horizon cycle prediction
- Weak on sudden consumption changes
- Performs well as a **pattern-focused forecaster**, not a **peak-level predictor**

Zone 2 – Last 7 Days vs 3-Day Forecast

## Zone 3 – Dependence & Stationarity Checks

Extended ACF (EACF) – Log Zone 3

```
> print(eacf(1z3))
```

AR/MA

	0	1	2	3	4	5	6	7	8	9	10	11	12	13
0	x	x	x	x	x	x	x	x	x	x	x	x	x	x
1	x	x	x	x	x	x	x	x	x	x	x	x	x	x
2	x	x	x	o	x	o	o	x	x	o	o	x	o	x
3	x	x	x	x	x	o	o	x	x	o	o	x	o	x
4	x	x	x	x	x	o	o	x	x	o	o	o	o	x
5	x	x	x	x	x	x	o	x	o	x	o	o	o	o
6	x	x	x	x	x	o	o	x	o	x	o	x	o	o
7	x	x	o	x	x	x	x	o	o	x	o	o	o	o

**ADF:** pass (stationary in differences)  
**KPSS:** fails (not level-stationary)

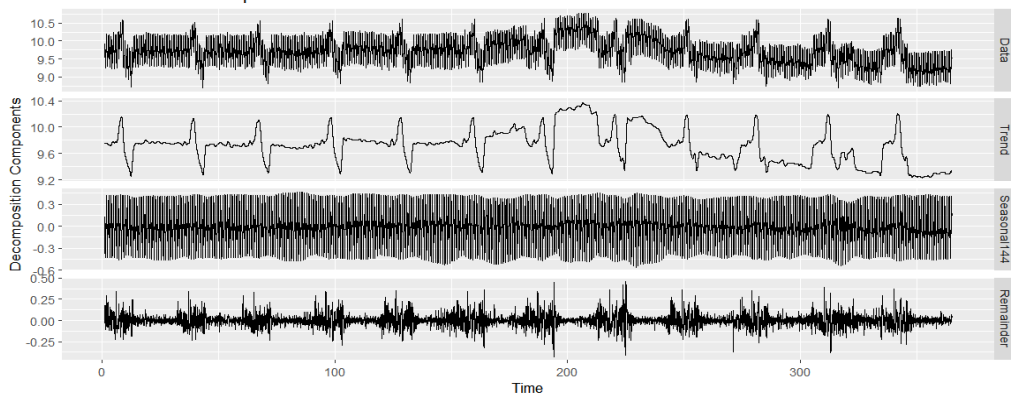

- Most volatile zone
- Deep seasonal structure
- MA-dominant pattern

# Zone 3: CCF, MSTL, and Model Fit Diagnostics

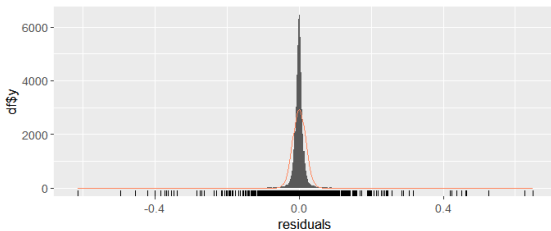

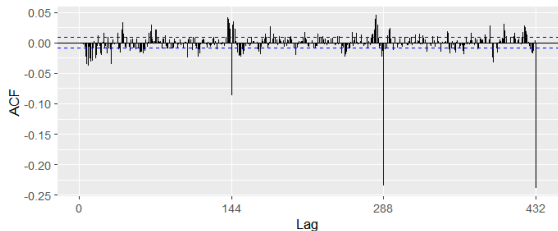

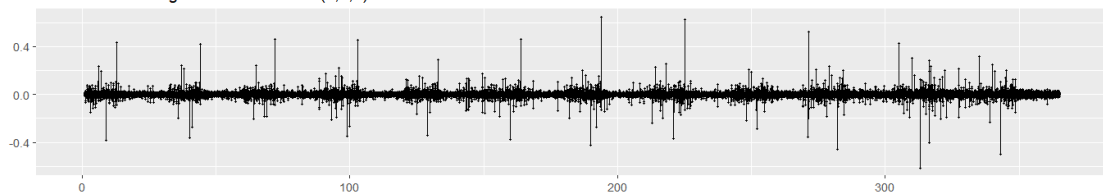

CCF: Zone 3 vs Temperature

Zone 3 – MSTL Decomposition

Residuals from Regression with ARIMA(0,1,5) errors

**CCF with Temperature:** repeating high-amplitude cycle; strongest temperature link

**MSTL:** clear intraday seasonality; trend more irregular than Z1/Z2

**Model Form:** ARIMA(0,1,5) + Fourier + Temperature

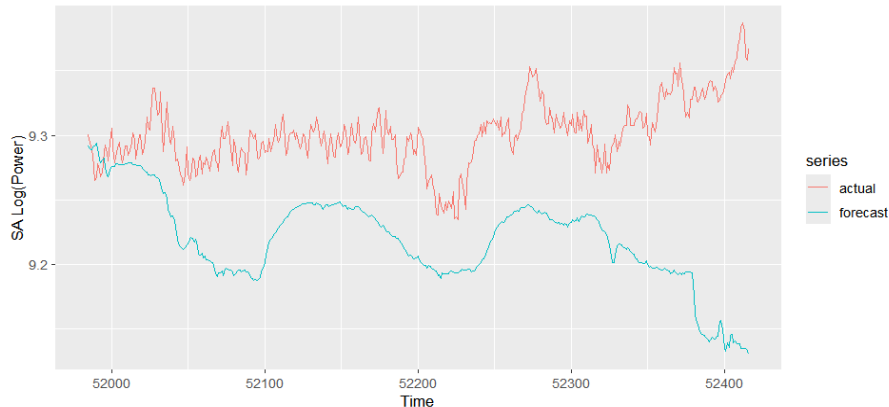

**Residuals:** centred; variance stable; seasonal lags still visible

## Model Selection

- Lowest AICc among Zone 3 candidates
- MA-dominant remainder matches EACF pattern
- Fourier captures daily structure; temperature improves short-horizon response

# Zone 3 — Back-test Accuracy and 3-Day Forecast

Backtest — Zone 3 (Seasonally Adjusted, Log Scale)

## Back-test Accuracy (Seasonally Adjusted, Log Scale):

- **RMSE:** 0.04122
- **MAE:** 0.03490
- **MAPE:** 0.37%

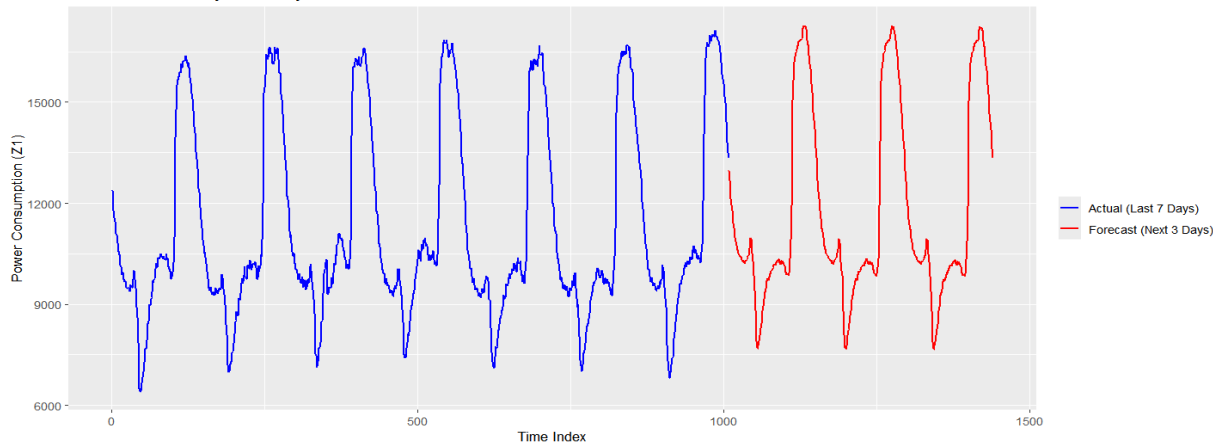

## Model Behavior:

- Daily cycle captured with consistent timing
- Forecast stays smoother than true consumption
- Underestimates sharp peaks and sudden load changes

## Final Takeaway:

- Strong short-term seasonal pattern recovery
- Limited handling of abrupt demand spikes
- Effective for **cycle prediction**, not for **level-shift** or **volatility forecasting**

Zone 3 – Last 7 Days vs 3-Day Forecast

# Challenges Encountered

- Structural limitations of the dataset
- Time and frequency structure problems
- Daily aggregation wiped out essential signal
- Autocorrelation far stronger than standard models assume
- Multivariate modeling instability
- Exogenous and seasonal components were difficult to extract cleanly

# Key Learnings

- ✓ High-frequency data behaves fundamentally differently
- ✓ Strong autocorrelation dominates model behavior
- ✓ Seasonality is multi-layered, not single-cycle
- ✓ Aggregation can destroy critical information
- ✓ Exogenous signals may be weak even if correlated
- ✓ Classical models struggle with sudden level shifts
- ✓ Multi-step forecasting amplifies uncertainty

# Conclusion

Our analysis showed that reliable forecasting for this dataset is only achievable when the model directly captures the strong intraday seasonal structure. Daily ARIMA/SARIMA and VAR-GARCH approaches struggled with the extreme autocorrelation and high-frequency volatility. The Fourier + Exogenous Regressor model produced the most stable short-term results by learning the 10-minute cycle, though it still smoothed sharp level shifts. Overall, the project established a solid baseline forecaster and clarified the limits of classical time-series methods for dense, operational load data.

# Future Work

- Extend dataset to multiple years to capture annual and long-term seasonal structure
- Incorporate additional exogenous drivers (holidays, operational schedules, regional demand)
- Explore machine-learning and hybrid models (LSTM, TFT, Prophet + ARMA residuals) for regime shifts

Thank You
